Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1897 Excerpt: . a known common tangent. A dash beneath such a letter denotes a common tangent which is to be determined so that the conditions of the problem shall be satisfied. Suppose we have given five points $-2, b, e_2, r_2, e$, which are double points, and five points $1, 2, 3, 4, 5$, which are simple points, on a quintic curve. The curve is then completely determined, and we wish to draw the curve. Take the four points a, b, c, d , as the base points of a sheaf of conics and $a, b, c, d, e, 1, 2$, as the base points of a sheaf of cubics that are tangent to a certain undetermined line at e . In order that e may be a double point on the generated curve, it is necessary that the cubic of the sheaf having a double point at e shall correspond to the conic through the five points a, b, c, d, e . If we denote the cubic having the double point by $(a, b, c, d, e, 1, 2) e_2$, we may express the condition that the quintic shall pass through $3, 4, 5$, and have a double point at e in the form $(a, b, c, d, e, 1, 2) e_2, 3, 4, 5$ A $(a, b, c, d, e, 1, 2) e_2, 3, 4, 5$; i.e. in the sheaf with base $(abcd)$ the conics determined by the additional points $e, 3, 4, 5$, respectively taken in this order, must correspond projectively...
